

**Problem 1.2.23** (Iowa, Winter 2016). Find the fundamental group of the space obtained from the three disk by identifying a finite collection of points. That is, find  $\pi_1(D_2/A)$  where  $A \subseteq D_3$  is finite.

First assume  $|A|=2$ . Consider the space made by attaching a 1-cell to the points of  $A$ ; it is homotopic to both  $D^3/A$  via contracting the added 1-cell, and it is also homotopic to  $D^3 \vee S^1$ , contracting along a path between the two members of  $A$ .

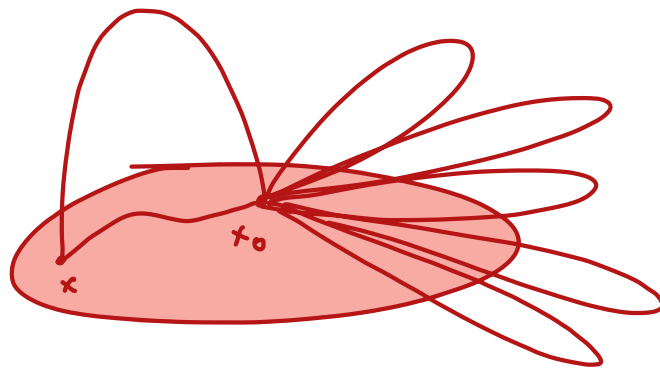

Thus  $\pi_1(D^3/A) \cong \pi_1(D^3 \vee S^1) = \mathbb{Z}$ .

Inductively assume  $D^3/A$  is homotopic to  $D^3 \vee \bigvee_{i=1}^{n-1} S^1$  for some  $n$ .

1. Now add one  $x \in D^3$  to  $A$ . As before, consider the space obtained by attaching a 1-cell to  $x$  and the wedge point  $x_0$ .

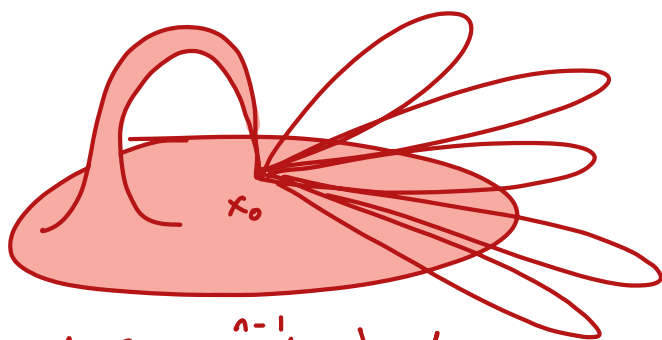

Then we can contract along this 1-cell or a path connecting  $x$  and  $x_0$  to get the desired homotopy equivalence:

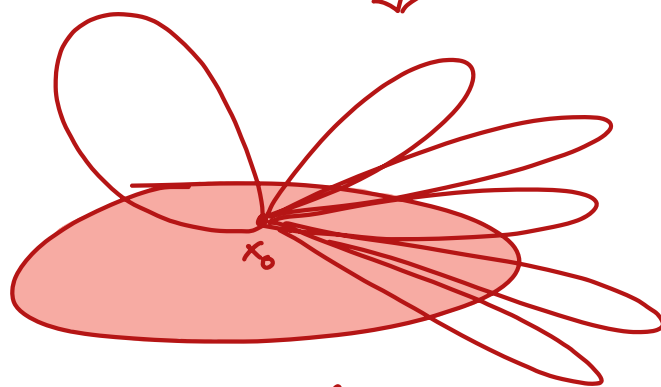

hfpC

$$(D^3 \vee \bigvee_{i=1}^{n-1} S') \vee e_1$$

hfpC

$$(D^3 \vee \bigvee_{i=1}^{n-1} S') / (x \sim x_0)$$

$$D^3 \vee \bigvee_{i=1}^n S'$$

Thus  $D^3/A$  is homotopic to  $D^3 \vee \bigvee_{i=1}^{|A|-1} S'$ , and therefore

$\pi_1(D^3/A)$  is isomorphic to the free group on  $|A|-1$  generators (i.e., the  $(|A|-1)$ -fold free product of  $\mathbb{Z}$ ).
